Analyses accounting for climate

The results below follow the same rationale as the ones from the main document. However, in the cases below all analyses use the plant traits already accounted for climatic effects by using the residuals from the regressions between each trait and the first three Principal Components of the climatic variables obtained from BioClim (REF).

Figures and tables

Appendages

PC1 - Parameters

Figure 1: Distribution of Theta (A), Alpha (B) and Sigma (C) values for the OU-based models for each continuous trait in association with different states of Appendage.

PC1 - Parameter differences

Table 1: Differences in Theta values for PC1 analysis of Appendages. Each cell contains the number of replicas for which the row state was higher than the column state. Green cells highlight cases with more than 150 replicas, orange cells highlight cases between 125 and 150 replicas, and yellow cells highlight cases between 100 and 125 replicas.

	Corola Length			Hole Diameter			Leaf Area			Petiole Length			Stem Area		
	none	variable	spines	none	variable	spines	none	variable	spines	none	variable	spines	none	variable	spines
none	0	101	105	0	69	66	0	101	114	0	103	102	0	109	102
variable	90	0	81	106	0	66	97	0	103	75	0	75	86	0	94
spines	84	85	0	109	75	0	84	80	0	76	84	0	93	85	0

Table 2: Differences in Alpha values for PC1 analysis of Appendages. Each cell contains the number of replicas for which the row state was higher than the column state. Green cells highlight cases with more than 150 replicas, orange cells highlight cases between 125 and 150 replicas, and yellow cells highlight cases between 100 and 125 replicas.

	Corola Length			Hole Diameter			Leaf Area			Petiole Length			Stem Area
